ARCHERY BALANCE TRAINER

USER MANUAL

(Version 2.2) January, 2020

BALANCE TRAINER

1   Introduction

Standing is the human position in which the body is held in an upright position and supported only by the feet. This position looks static, but in reality is not. The body is constantly moving (body sway) forward and backwards and side to side.

For archery it is essential that the body remains in the same position. Archers use visual, proprioceptic (muscle-feeling) and vestibular feedback-loops to control this inherent unstable position[1]. And then there are the external disturbances such as wind and wind gusts that add to this instability as well.

The archer's body needs to be as stable as possible.

The Wii Balanceboard can accurately[2][3][4] detect movements of the body center-of-gravity. This, in combination with the Archery Balance Trainer software provides the archer and coach with an efficient tool for training exercises tailored for archery balance training.

The most efficient way to learn is with short feedback loops. With the audio feedback provided by the system, archers can practice keeping and correcting their balance and also train their muscles and central nervous system to quickly and efficiently detect and react to external disturbances like wind and wind gusts. The balance trainer system is specially designed for these applications.

Also, archers can check the consistency of their shooting form, by comparing the center-of-gravity movements from one shot to the other.
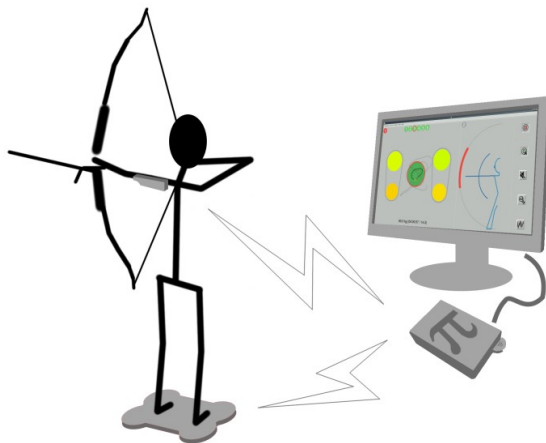

Have fun!

- Marcel van Apeldoorn

2   Installation

The Balance Trainer comes in two different forms;

1. As a complete ready-to-run hardware box called the **Balance Trainer System**.
2. As a do-it-yourself micro SD Card image for a Raspberry Pi.

To use the Balance Trainer (in any of the above forms), you also need:

- An **<u>original</u>** Nintendo Wii Balanceboard
- An Nintendo Wiimote or equivalent
- A Computer screen with HDMI input and HDMI cable
- A standard 5V 2A micro USB power supply[5]

2.1   Balance Trainer System

What's in the box? The Archery Balance Trainer System consists of a Raspberry Pi in a small housing. In the Pi 2B is in one of the 4 USB ports, a Bluetooth dongle installed. The Pi 3 and 4 have Bluetooth on the board itself. The micro SD Card reader of the Raspberry contains a micro SD Card with the operating system and the Balance Trainer software. A pin code is provided on a leaflet that goes with the package. This pin code is only valid for this specific system.

Installation of the Balance Trainer system is straightforward;

1. Connect the computer screen via the HDMI cable to the Balance Trainer box
2. Connect a USB mouse (wired, or through a dongle)
3. Connect the 5V 2A micro USB power plug (the system will boot up immediately)
4. Once started, go to the Setup section

2.2   Raspberry SD Card Image

If you own a Raspberry and want to do-it-yourself, these are the steps you need to follow;

1. Download the micro SD card image from the website (the file is about 2.4Gb, but extracts to an image of 16Gb so make sure you have at least this amount of free disk space).
2. Download and install balenaEtcher. This is a graphical SD card writing tool that works on Mac OS, Linux and Windows, and is the easiest option for most users. It can be found here https://www.raspberrypi.org/documentation/installation/installing-images/README.md
3. Unzip the image.
4. Plug the SD card into an SD card slot or adaptor for your PC.
5. Run balenaEtcher
   a. Select the image
   b. Select the SD card

---

[5]   2A is recommended for the Raspberry Pi to operate stable. Less than 2A will not do.

        c.   Write it
6. Once the writing is done plug the SD card into the Raspberry Pi and power it up
7. Go to Setup

3 Setup

If the power is plugged into the system, it starts automatically. There is no on/off switch. The very first time you start the system, the Wii Balanceboard and Wiimote need to make themselves known to the system (i.e. *paired* to the system) before they can be *connected* to the system.
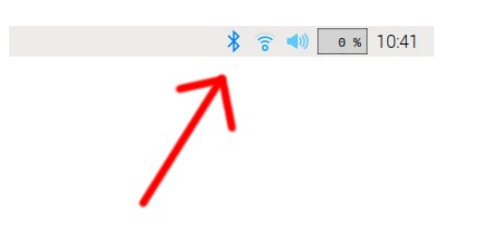

So, the first step is to *pair* them.

3.1 Pairing

Open up de battery cover on both the Wii Balanceboard and the WiiMote and find the small red 'pairing' buttons.

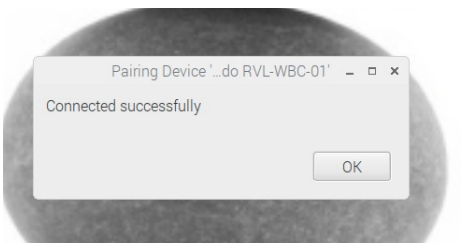

The Bluetooth adapter software is located on the top action-bar on the right side of the screen. Left-click on it to get the menu.

The steps of pairing are the same for either of them. The description below is for the primary Bluetooth configuration software;

	Left click the Bluetooth icon for menu, to make sure the Bluetooth adapter is turned on.

	Left click the Bluetooth icon and choose Add Device
	Open the battery cover of both Wiimote and Wii Balanceboard
	Click the red pairing button in the Wiimote and the Wii Balanceboard.
	You should find at least two devices
	Click on the Wii Balanceboard (with WBC in the name) and click pair (and within a few seconds, click the red button in the Wii Balanceboard again. If you get an error, simply try again, or in the worst case, try the secondary Bluetooth software or reboot the system.

	Do the same for the Wii mote controller (with CNT in its name)
	If both controllers are paired, start the Balance Trainer software

If you lose connection in the Balance Trainer system (e.g. you pulled the batteries out of the Wii motes, or they auto-shutdown because of no action) then restart the Balancetrainer software and simple push the blue button on the front of the Wii Balanceboard to restore the connection, and press any button on the Wii mote to restore the connection. Then select Connect in the Balance Trainer software menu.

3.2   License Key

If you have purchased the complete Balance Trainer System, the license pin is already activated, and you can skip this section. However, if you have upgraded your system, you also need to enter your license key so the following also applies.

If you downloaded the SD card image or the Linux software, the first time you try to setup a connection with (menu Connection → Connect) a license dialog is shown. If you've already purchased an unlock pin, enter it here and unlock the software.

If you've downloaded the SD Card image or the Linux software and want to test your setup, enter anything. This will enable you to test (for 30 seconds) the system, to make sure the signals of both devices are received (just move the WiiMote and slightly press one of the Wii Balanceboard's feet).

If your own custom system reacts OK (both Wii Balanceboard and Wii mote seem to work), then an unlimited Pin can be purchased from the developer upon request.

Request a pin code here: info@vapeldoorn.net

If you have made a mistake in entering the pin you can reset the license in the Help menu and restart the Balance Trainer software.

4   Using the Balance Trainer

The Balance Trainer works by measuring the center-of-gravity of the archer standing on the Wii Balanceboard and comparing this with a target area. If the system is *armed* and the center-of-gravity moves *outside* the target area an audio alert signal is given.

4.1   The Interface

The interface of the Balance Trainer program is divided into two main frames. On the left is the balance frame. On the right is the stance frame. The balance frame shows the real-time measured center-of-gravity of the archer. The stance frame shows the real-time measured position of the bow-arm. On the far right is a control panel and on the top is a menu bar and at the bottom a status bar.

4.1.1   The Balance View (left side)

The balance view consists of two feet outlines, representing the archer's feet, with each foot outline containing two pressure circles (so 4 pressure circles in total). In the center of the view a small yellow dot represents the archer's measured center of gravity. When the archer moves his body, the center-of-gravity dot moves (and leaves behind a history trail) and the pressure circles indicate the weight distribution of the archer in different colors.

At the bottom, the weight of the archer is displayed, the time the system is up and running, and the average frames-per-second that the system refreshes.

A big green circle is shown. This circle is called the ***target area***. The target area is green, with a red outline. If the center-of-gravity lies within the green circle (inside the green), the system is quiet. No audio signal is given. When the center-of-gravity moves out of the target area and into the alert area (passes the red outline), an audio alert is given.

Two types of target areas can be selected (in the menu Options → Range);

- A green circular area with a red outline; The circular target range sounds the alarm when the center-of-gravity moves outside the circle. You can move the green area with the mouse by left-click and hold, then move the area. You can change the size of the area by keeping the pointer inside the area and turning the mouse wheel.
- Or two (green and red) parallel lines; The target range with two straight lines, sounds an alarm when the center-of-gravity crosses the lines to the side of the red line. You can move the two parallel lines with the mouse, by left click and hold on either of the lines and move. You can rotate the lines by hovering the pointer over the lines and turning the mouse wheel.
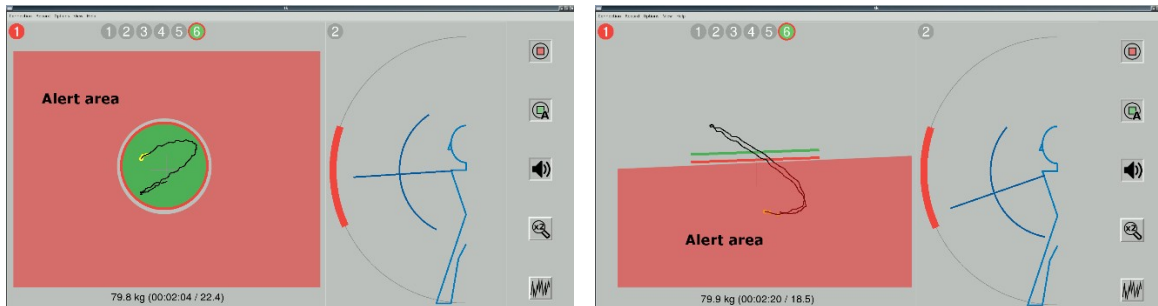

The purpose of the balance trainer lies in the fact that the archer learns (through the audio feedback) to recognize (upper) body movements that result in shifts in the center-of-gravity and how to correct this. Therefore, there is a 'target' area for the center-of-gravity to be in. Once outside this 'target' area (and armed), the system starts the audio signal.

If the system is 'armed' it will start the audio signal if the center-of-gravity lies outside the target area. If the system is unarmed, nothing happens.

To ***arm*** the system, press the record button

Manually arming (and disarming) the system can be done by a coach. Once the archer is almost or at full draw, the system can be armed and the movement of the center-of-gravity is recorded and an alert is given if it moves outside the target area. After the arrow is shot, lots of movement happen and the system will for sure give an alert. To prevent this, the coach needs to disarm the system by clicking the record button again.

Instead of having the coach arm and disarm the system, automatically arming and disarming can be done using the WiiMote, based on whether the archer is at full draw. This is explained in the next section.

4.1.2   The Stance View (right)
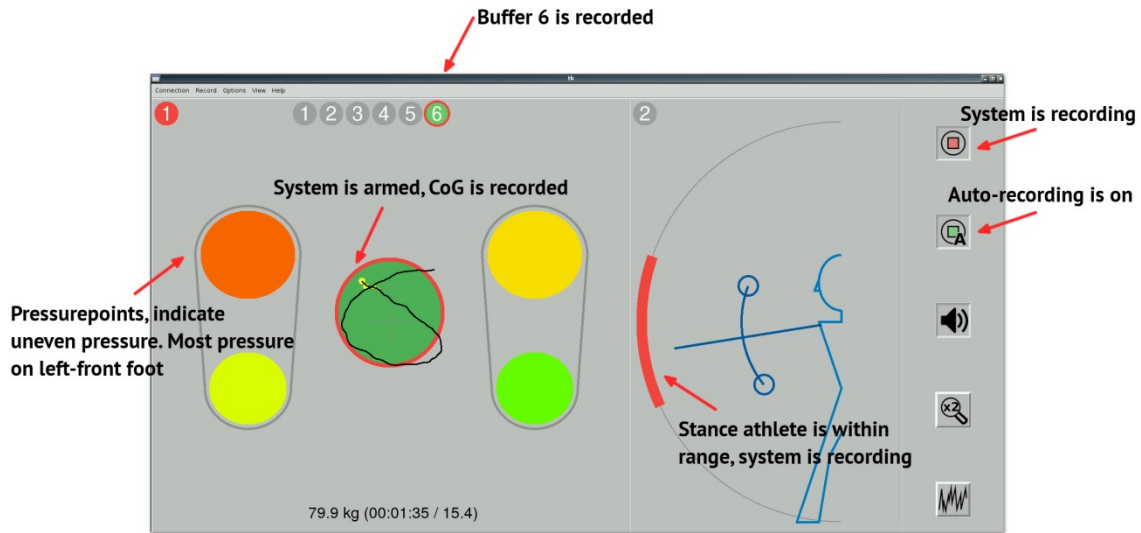

The stance view shows the archer's side view. The arm position is measured by the WiiMote (which is attached to the outside of the bowarm) and shown in the stance view.

The Stance view is used to automatically arm and disarm the balance trainer. In auto-mode, when the system is *active* (the stance bar is green) and the bow-arm is lifted and points *inside* the green bar. The green bar turns *red* and the system is *armed*. In this armed state, whenever the center-of-gravity position is outside the green balance area, the system will give an alert.

When the archer shoots and drops the bow-arm, the system goes into *inactive* mode for a short period of time, before entering *active* mode again.

4.1.3   Attaching the WiiMote

You need a spare armguard (e.g. a Beiter-like armguard works well). Attach the WiiMote with double sided adhesive tape to an extra armguard as shown in the next picture.

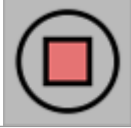

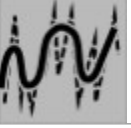

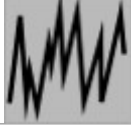

Now put this extra armguard on, such that the WiiMote is on the outside of the upper arm of the bow-arm and is pointing towards the target when the bow-arm is at full draw. Make sure that the buttons of the WiiMote are facing up. As shown in the next picture of an archer wearing the WiiMote.
4.1.4   The Control Panel

The control panel consists of buttons that turn functions on or off.

Button	Function
	Press to **arm** or **disarm** the system. When armed it records the center-of-gravity path (and alert). Doesn't matter where the bow-arm is. You can operate the system without a WiiMote on the bow-arm (only connect a Wii Balanceboard)
	Use the bow-arm position to automatically arm and disarm. You need to connect both Wii Balanceboard and the WiiMote to use auto-recording.
	Indicates whether the audible signal (when the center-of-gravity is outside the target area) is muted or not.
	The signal is multiplied 1x, 2x, 3x, 4x or 5x times. The higher the number the more accurate the system becomes
	Indicates whether the signal from the Wii Balanceboard and WiiMote is smoothed or raw.

4.1.5   The Menu

Besides the control panel buttons, the system can be operated through a menu. It's items are explained below;

Connection		
	Connect	Set up a Bluetooth connection to the Wii Balanceboard and the WiiMote. **Note that the system first has to be paired with the two devices!** On the bottom of the application window is a status bar. When both devices are connected, two green indicators are shown. If either or both devices are not connected a red indicator is shown.
	Simulation	Simulate a connection to a Wii Balanceboard and a WiiMote. This way you can 'learn' the interface and try stuff without actually connecting the Wii's
	Quit	Quit the software

Record		
	Auto Record	Turn on auto arming
	Record	Arm the system
	Calibrate	Calibrates the system
	Calibrate Display	Repositions the drawing of the center (and the feet).
	Reset Calibration	Resets both System and Display calibration
	Select	Select buffer 1 … 6 to use for recording
	Show	Show the recorded path of buffer 1 … 6
Options		
	Sound	Turn on/of sound
	Accuracy	The center-of-gravity path is multiplied 1x ... 5x. 1x is least accurate, 5x is max accuracy
	Range	The target area can be either a circle or a line
	Re-arm delay	Set the re-arm time delay from 0 sec … 20 sec.
	Alarm sound	Choose an alarm sound
	Signal smoothing	Smooths the signal from the Wii Balanceboard
	Bezier lines	Draws smooth lines on the display (when recording). This introduces a small performance penalty (so for highest performance, highest frame-rate, turn this off)
	Performance mode	Performance mode on/off. When on, the lines are drawn in a higher performance mode, resulting in an improved frames- per-second.
View		
	Show grid	Show a grid
	Show feet	Turn on/off the feet outlines
	Show axis	Turn on/off the axis
	Show pressure	Turn on/off the pressure indicators in the feet (this improves frames per second performance slightly)
	Show weight	Show weight of athlete (in kg) instead of frames-per-second
	Sport	Choose a sport (only changes the archers symbol) from Recurve Bow, Compound Bow, Pistol, Rifle
	Theme	Choose different color themes (requires a restart of the software)
Help		

|	Help	Show the user manual
	Reset License	Reset the license file (you need to enter the pin code again)
	Reset Options	Reset the options to default (requires a restart of the software)
	Show log	Show a logging window
	Info	Shows the info dialog
	Copyright	Shows copyright and disclaimer statement

4.1.6   The Status Bar

The status bar indicates some feedback on menu items, indicates which Wii's are connected and the version of the software that is currently running.

4.2   Controlling the Balance Trainer

Typical control is done using a mouse that is connected to the system. One of the three free USB ports can be used to attach a wired USB mouse, or a USB mouse dongle.

The main use of the mouse is to click on the buttons in the control panel, operate the menu and move and change the size of the target area in the balance frame or the reference area in the stance frame. See the next picture.

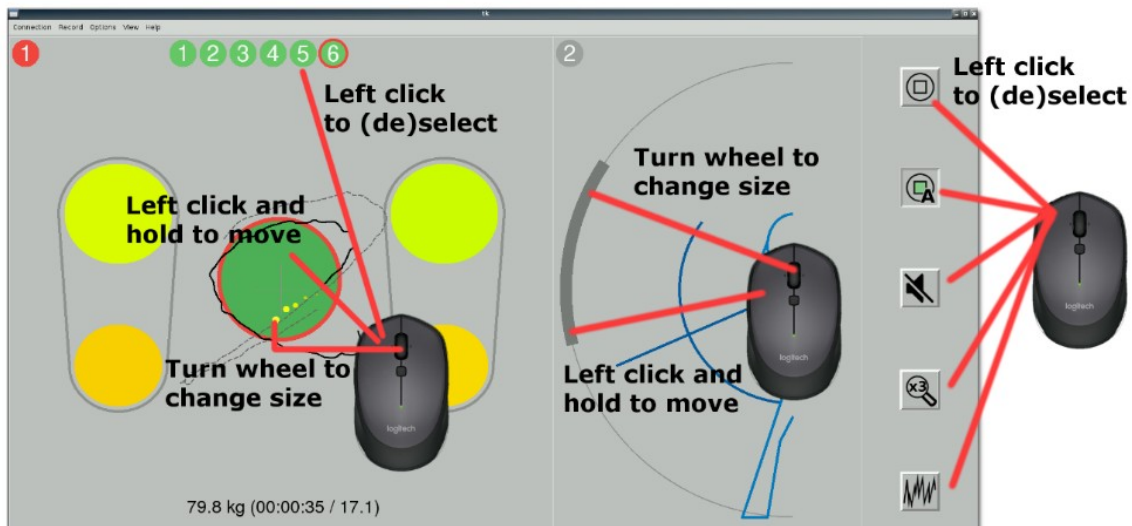

An alternative way of controlling the software is through the WiiMote itself, as shown in the next picture. When using the WiiMote, first use button 1 or 2 to select the Balance frame (1) or the Stance frame (2).

13

Then use the move and size buttons to move and change the size of either the center-of-gravity target area or the bow-arm target area.
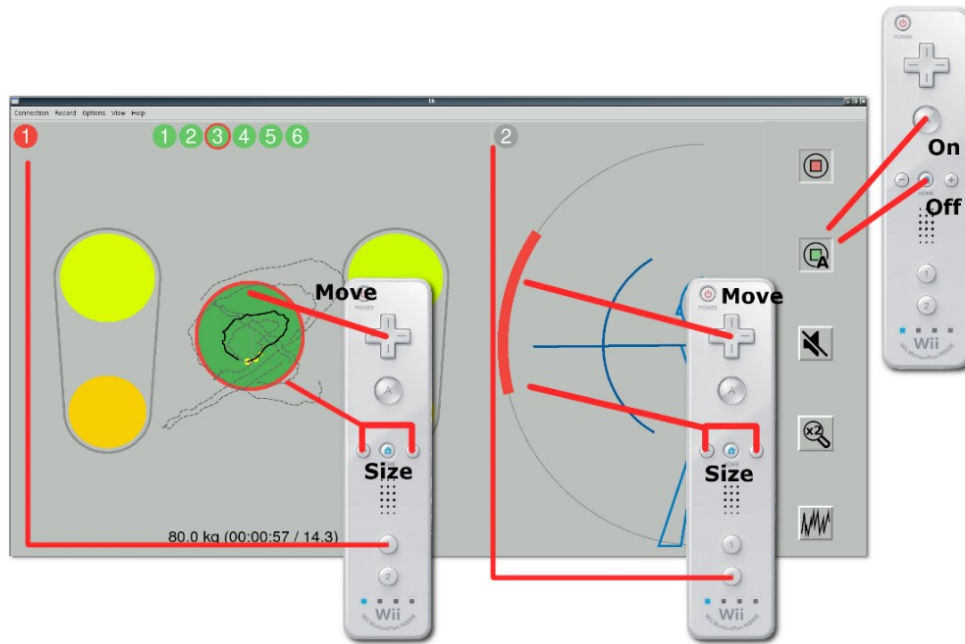

4.3   Coordinate Systems

The Wii Balanceboard needs to be placed on the shooting line as shown in the figure below (for right handed archer). The small bluetooth button on the side of the Wii Balanceboard needs to point backwards (in the negative X-direction)
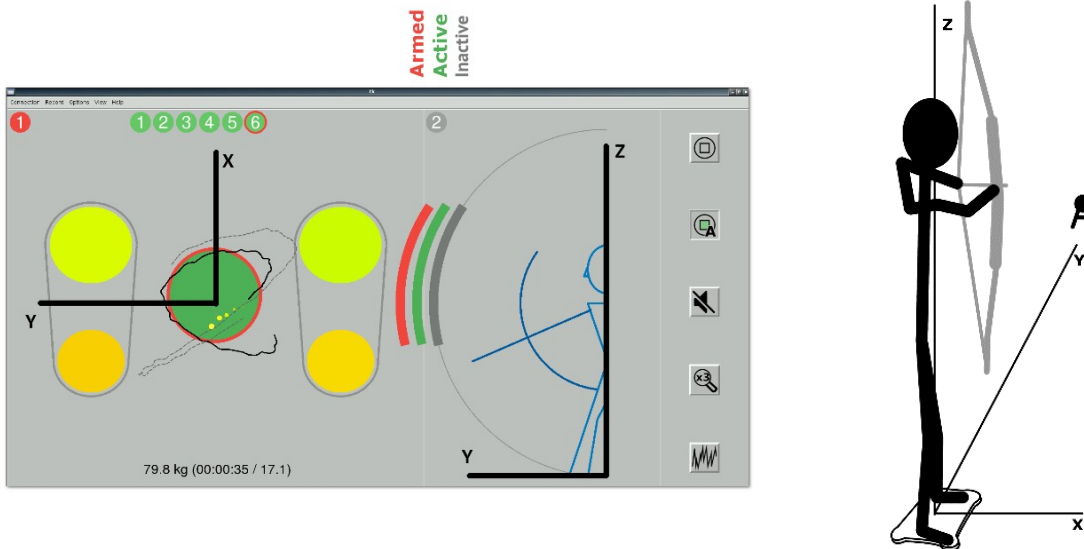

5   About the Operating System

The operating system is called Raspbarian (which is a Linux derivative). If for some reason you have exited the Balance Trainer program, you see an empty screen with the Balance Trainer logo on it. On this screen, click in the top-left (on the Raspberry symbol) to get a menu, then select the First menu item "Balance Trainer". **Only go into other menu's if you know what you're doing!**

Raspberry Menu Item	Function
Start Balance Trainer	Start the balance trainer program
Start Balance Trainer (no aplay)	Start an alternative variant of the Balance Trainer (if you have problems with delayed audio, this might help)
(Re)start Bluetooth	This normally isn't necessary, but if everything fails with Bluetooth you might try to restart it.
Reset Balance Trainer Options	Resets the Balance Trainer options to default. Also resets the license key, which you need to (re)enter once you start the BalanceTrainer
Update/Reinstall	This will update or re-install the BalanceTrainer software. **An internet connection is required!** Connect the BalanceTrainer system to a wired DHCP enabled router/switch then select this menu. A terminal will pop-up asking if you are sure and then the progress of the update will be shown.
User manual	Shows the PDF User Manual
Shutdown	Shutdown the system

Tip; If a window disappears behind the Balance Trainer window, use Alt-Tab to get it in front again.

6   About the Author

The Balance Trainer system is developed by Marcel van Apeldoorn, an enthusiastic archer since 1991. He was a former international archer and is currently head coach of the senior compound team of the Netherlands. He represented the Netherlands at World Championships, European Championships and other international events as (recurve) competitor and (recurve and compound) coach for more than 30 times. In his professional life he has a Master of Science degree in Aerospace Engineering, and holds a position as Senior Research and Development Engineer in the domains of Air-Traffic-Control systems, Software Analysis and Design, Software development, Human factors and Training at the NLR – Netherlands Aerospace Centre in Amsterdam.

Besides the balance trainer system, he also developed the Netherlands talent identification performance funnels and the popular Android apps Arrows and Artemis. Also the system which automatically identifies arrow impact positions on a target (to be used with Artemis) installed at the Netherlands Olympic training centre is developed by him.

To contact, use abt@vapeldoorn.net

"The idea for the balance trainer dates back to 2009 when the Wii Balanceboard came on the market. As a software professional I expected that the (proprietary) Bluetooth protocol that Nintendo used would be reversed engineered and it was just a matter of time before enough information was found on the internet about this. This enabled me to build a system that was able to measure the center-of-gravity movements of an archer.

It happens that the Wii Balanceboard is very accurate and an inexpensive alternative to laboratory-grade force plates[6] with very accurate repeatability within a single board. This makes it more than just a toy, but a very useful tool in the training of archers.

Currently, the Balanceboard trainer is used by coaches in more 6 countries."

- Marcel van Apeldoorn -
January, 2020

---

[6] See for example *"Accuracy of force and center of pressure measures of the Wii Balance Board"*, Harrison L. Bartlett, et al., Gait & Posture 39 (2014). [From conclusion] *"In conclusion, the WBB is an inexpensive, portable device that may be useful for measuring vertical ground-reaction forces and COP with limitations on accuracy and precision."*
